

**AMENDMENTS TO THE CLAIMS**

1. (Currently Amended) A self-charging organic electroluminescent display module, comprising:

a first substrate;

at least one organic solar cell coated on the first substrate;

a second substrate; and

at least one organic electroluminescent device formed on the second substrate;

wherein the solar cell provides necessary electrical energy for the organic electroluminescent device to function and the first substrate, the second substrate, the solar cell, and the organic electroluminescent device are packaged together;

wherein the solar cell and the organic electroluminescent device are facing each other and attached on the first substrate and the second substrate, respectively, using a packaging adhesive.

2. (Cancelled)

3. (Previously Presented) The self-charging organic electroluminescent display module of claim 1, wherein the surface of the first substrate that the solar cell is not on and the surface of the second substrate that the organic electroluminescent device is not on are attached to each other using the packaging adhesive.

4. (Previously Presented) The self-charging organic electroluminescent display module of claim 3, further comprising a first cover corresponding to the solar cell and a second cover

corresponding to the organic electroluminescent device, wherein the packaging adhesive is employed to combine the first substrate with the first cover and the second substrate with the second cover.

5. (Cancelled)

6. (Cancelled)

7. (Cancelled)

8. (Cancelled)

9. (Cancelled)

10. (Cancelled)

11. (Original) A self-charging organic electroluminescent display module, comprising:  
a common substrate;  
at least one solar cell formed on the common substrate;  
an opaque insulating layer formed on the solar cell; and  
an organic electroluminescent device formed on the opaque insulating layer;

wherein the solar cell provides necessary electrical power for the organic electroluminescent device to function and the common substrate, the solar cell, and the organic electroluminescent device are packaged together.

12. (Previously Presented) The self-charging organic electroluminescent display module of claim 11, further comprising a common cover corresponding to the locations of the solar cell and the organic electroluminescent device, wherein a packaging adhesive is employed to combine the common substrate and the common cover.

13. (Previously Presented) The self-charging organic electroluminescent display module of claim 11, wherein the solar cell is an inorganic solar cell.

14. (Previously Presented) The self-charging organic electroluminescent display module of claim 11, wherein the solar cell is an inorganic solar cell.

15. (Currently Amended) A self-charging organic electroluminescent display module, comprising:

a common substrate;

at least one organic solar cell formed on a first surface of the common substrate; and

at least one organic electroluminescent device formed on a second surface of the common substrate opposite to the first surface;

wherein the solar cell provides necessary electrical power for the organic electroluminescent device to function and the common substrate, the solar cell, and the organic electroluminescent device are packaged together;

a common cover corresponding to the locations of the solar cell and the organic electroluminescent device wherein a packaging adhesive is employed to combine the common substrate and the common cover.

16. (Previously Presented) The self-charging organic electroluminescent display module of claim 15, wherein the common cover includes a first cover corresponding to the first surface and a second cover corresponding to the second surface, and the packaging adhesive is employed to combine the first cover with the first surface and the second cover with the second surface.

17-18. (Cancelled)
